ECO TRACK

“EcoTrack: A Smart Plastic Waste Recycling Tracking System”

A centralized digital platform to monitor and track plastic waste from collection to recycling, improving transparency, efficiency, and sustainable waste management.

INTRODUCTION

Plastic waste has become a major environmental challenge in urban areas like Delhi, Mumbai, and Chennai. Improper disposal, lack of segregation, and inefficient recycling systems contribute to pollution and health risks. Effective waste management requires proper tracking, monitoring, and coordination among all stakeholders.

SCENARIO

Plastic waste is often mixed with general waste, making recycling difficult. Recycling centres struggle to track incoming and processed waste. Informal waste collectors operate without proper records or coordination. Government initiatives exist, but monitoring participation and efficiency is challenging due to incomplete and scattered data. This results in poor waste management and environmental pollution.

SR UNIVERSITY

PROBLEM STATEMENT

The current system lacks a centralized platform to track plastic waste from collection to recycling. There is no real-time monitoring, proper coordination, or accurate data management, leading to inefficiencies, low recycling rates, and environmental damage.

OBJECTIVES

- Design a system to track plastic waste collection and recycling
- Improve transparency and coordination
- Enable real-time monitoring and reporting
- Support efficient data management
- Promote sustainable waste practices
